

Notification Service

READY add-on module

Knowing when, where and how to act on situations that may arise in your distribution network saves valuable time and reduces costs. With its Notification Service module, READY provides timely notifications of your water and heat/ cooling meter portfolio.

You adjust notification settings based on your preferred info codes, forwarding methods and meter groups. This means that you can choose which info codes and meter groups you want to be notified of and the Notification Service module then uses these priorities to transmit notifications from your meters.

Notifications via e-mail, smart phone/tablet or both

The Notification Service module enables you to configure READY Manager to notify you of active info codes in your network via e-mail, smart phone/ tablet or both.

All you have to do is choose which info codes you want notifications of, one or more meter groups and how you prefer to be notified – all easily configured in READY Manager. The only difference between e-mail and smart phone/ tablet is entering an e-mail in case of the previous and a mobile number in case of the latter.

The Notification Service module is designed to be a flexible solution. So if you prefer to be notified of active info codes both via text message and e-mail for later written confirmation of the incident, simply create one notification setting for text messaging and one for e-mail – both with the same user-defined meter grouping. Use the info code prioritisation feature to determine importance and configure which are urgent for text messaging and e-mailing respectively.

How do I get READY Manager to forward my notifications?

The Notification Service module is an add-on service for hosted READY Manager customers. Simply place an order and it will automatically be updated. For non-READY Manager customers, place an order for your READY Manager and order the Notification Service module as well.
