

Meter Exchange

READY add-on module

Continuous maintenance of meters and thus handling meter exchange involve several manual processes that can be both smarter and more efficient. With the Meter Exchange module, READY simplifies and ensures the process of exchanging meters in your distribution network.

The manual processes related to meter exchange present the risk of human errors like typing errors and bad handwriting. The Meter Exchange module eliminates these risks whilst ensuring correct data handling and very secure data storage. Furthermore, future traceability on the steps taken is very simple because all data will be accessible in READY Manager.

Performing meter exchange and customer reporting

Exchanging a meter is a simple step-by-step action with READY App on site or with READY Manager afterwards. After a meter exchange with READY App, meter values, photos and notes are easily synchronised to READY Manager, where all meter data is stored.

For every meter exchange it is possible to store your notes and up to five pictures of for example the replaced meter, the new meter or other applications you consider relevant in the specific situation. Once the data is in READY Manager, it is easily transferred to other maintenance systems. This means that it is only necessary for you to read the meter data once and in one system – not in several systems and on paper as custom in many cases today.

Present and future

With the Meter Exchange module, you only need to read exchange data once. READY App and READY Manager create an installation report with your own pictures and documentation, which is easy for you to share with your customers.
