

Pipeline Integration Heat Intelligence

With Pipeline Integration, we integrate your distribution network into the Kamstrup analytics platform Heat Intelligence.

This allows Heat Intelligence to make advanced calculations on your distribution system based on real-life data from each individual metering point back through the distribution network to the production plant. This gives you a whole new level of transparency – without having to invest in additional sensors.

What is in it for you?

- **Detailed master data**
As part of integrating your pipeline into Heat Intelligence, we will provide you with feedback if we find areas with errors or if the data is inadequate. This allows you to correct your master data, making future updates of the pipeline easier and faster.
- **Increased transparency**
With accurate data on your distribution network, you can see the temperature and flow of all pipes in your distribution network from your production plant to each individual consumer, giving you a better basis for making the right decisions.
- **Preventive maintenance**
The more detailed and precise data you provide the better Heat Intelligence can assist you in identifying trends, following developments and possibly even predicting what will happen in your distribution network so that your investments and preventive maintenance become fact-based.

Who is this for?

Pipeline Integration is for you who want to utilize the powers of Heat Intelligence. You want to be able to see what happens under ground as well as the temperature and flow of your distribution network, even where no meter is installed, by combining data from all meters with data on your distribution network.

What do you get?

Integration of pipeline layout

We contact you and coordinate to ensure that the pipeline layout is handed over to Kamstrup in the right format for integration into the Heat Intelligence platform.

Should the data be inadequate or if there are errors in the data provided, we will provide you with feedback so that you can update your master data and provide us with an updated version.

In this way, you benefit from having detailed master data allowing for easy update of the GIS data in Heat Intelligence when you make changes to your distribution network.

Should you need additional support, for example for updating your distribution network if it has been changed, this can be acquired upon request.

Ask your Kamstrup contact for more information.

Looking for more?

With our add-on services, you can customise your Heat Intelligence solution to give you just what you need.

These services include:

- **Up & Running** with Heat Intelligence to ensure you are off to a good start.
- **Book a consultant** to go through your distribution network with you.
- **Pipeline update** when making changes to your distribution network.
- ...and much more

Ask your Kamstrup contact for details.
